Windows® "USB Device not recognized" Error Notice

There can be a condition where the USB Server firmware will continue working with the Bridgemates (at the table) but no data is being transferred to the computer. The symptoms are:

- 1. The Bridgemate table units are operational with players entering results normally.
- 2. The Bridgemate Control Software (BCS) shows the server as "Not connected"
- 3. Usually when the server is disconnected from the PC and reconnected, there will be a Windows® error notice "USB Device Not Recognized."

Note: This error notice does not always appear on the PC.

4. Device Manager does not show a "Ports (COM & LPT)" listing.

Usually when the Bridgemates at the table are working – but BCS shows the server as "Not connected" – the solution is to disconnect and reconnect the server. Most often – within about a minute – BCS will show that the server is "Connected" and normal operation will resume. However, this will not help when the server's microprocessor continues to work with the Bridgemates but is not communicating with BCS.

When this happens the Bridgemates will continue to work, but Windows® often indicates "**USB Device not recognized**" when the server is reconnected.

Note: Some PC's may not show the "USB Device Not Recognized" error notice when the server is reconnected. Go to Device Manager to see if Windows is recognizing the server; if so, there will be a "Ports" entry with a "Bridgemate Communications Port (COMx)" listed. If this is showing, there is some other problem; however, if Windows is not recognizing the server, use the following to restore operation:

- 1. Disconnect the server.
- 2. Press and hold the <u>Battery off</u> button for several seconds.
- 3. This should extinguish the 2 LEDs. If they do not go off, remove at least one battery.
- 4. Reconnect the server and within about a minute, BCS will show that the server is "Connected."
- 5. Normal operation will resume, but the server will no longer have any game data.
- 6. Go to Server → Show Tables: This should show: "Total number of tables in server: 0" and have a button. Click on this button → answer both warning messages "Yes" and then enter the 3-digit number that is provided.
- 7. This recover-server action will put the game movement [and results already recorded] back into the server.

Normal operation will resume and players can enter results – from the point when the server firmware "lock up" occurred and BCS could no longer retrieve results from the server.

If BCS has been closed, everything can be restarted from ACBLscore using F11 \rightarrow BMS.

- Answer "Yes" to the warning message that the results file already contains data.
- The movement will be loaded into the server, but none of the results already entered.
- If you are going to have players re-enter any results already recorded, repeat step 6.

Often, however, some time will have elapsed and it is not practical for the players to re-enter the missing results. Each Bridgemate retains the board results in its internal memory – until a new game has been started and at least 1 score (from the new game) has been entered. Thus, with a simple command, these results can be resent to the server to be recorded into the Results (.bws) file.

To resend results, proceed as follows:

First:

*	If you are using BCS 3.2.23 to 3.7.6, go	o to Tools \rightarrow Options \rightarrow General – be sure th	e
	Restore re-sent backup scores automatically to		
	server	option is checked.	

❖ If you are using BCS 3.7.19 (or later) – displaying Results [or Result Matrix] – select "Backup scores"
✓ Accept manually re-sent backup scores from Bridgemate;

and check Restore backup scores automatically to server

Recovery procedure:

- Make sure the server is connected and loaded with the session data (tables, movements).
- Bridgemates which are still in result-entry mode can resend the results from the TD-menu.
 - a. Press the TDMENU function key
 - b. Enter your PIN code
 - c. Press RESEND function key.
- Bridgemates which show the main "Bridgemate II" screen can resend the results from the setup menu.
 - a. Press SETUP
 - b. Enter the Setup code (749 or 769)
 - c. Press the INFO function key
 - d. Press the RESEND function key
 - e. The Section/table and number of board results in the Bridgemate memory is displayed.
 - f. Press OK to start the retransmission.

Retransmission will only succeed when the server is active and contains the session data. After retransmission, the board results can be posted into the scoring program using normal procedures.

Special Note:

- With Bridgemate firmware v2.2.2, the Bridgemates will automatically reset themselves after retransmission and "going to sleep."
- With Bridgemate firmware v2.1.2 (and earlier), it is necessary to press the BACK key to return the unit to the introductory "Bridgemate II" screen.
